

## TLP v2.0 Quick Reference

Traffic Light Protocol — FIRST Standard v2.0 (August 2022) | CyberShelter UAE

| Label                      | Meaning                                                                                                                                                         | When to Use in an MSSP Context                                                                                                                                                                        |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>TLP:RED</b>             | For named recipients only. Not for further disclosure — not even within the wider organisation.                                                                 | A single client's live, unresolved incident (e.g., an active phishing campaign against one named client). Shared only with that client's direct security contacts on a call or named-recipient email. |
| <b>TLP:AMBER (+STRICT)</b> | Share only within your own organisation, and with clients who need to act on it. AMBER+STRICT limits sharing to the client organisation only, not its partners. | Internal analysis of a ransomware campaign affecting a client — shared with the SOC team and that client, but not published or passed to other clients/partners.                                      |
| <b>TLP:GREEN</b>           | Share within your community or sector (e.g., partner MSSPs, an industry ISAC), but not publicly on the open internet.                                           | A credential-stuffing pattern (source IPs, targeted domain types) shared with partner MSSPs or an industry sharing group so others can defend against the same campaign.                              |
| <b>TLP:CLEAR</b>           | No restriction. May be shared freely, including publicly. Replaces the retired TLP:WHITE (FIRST TLP v2.0, August 2022).                                         | A blog post or public advisory about a threat that has already been widely disclosed and patched, written for general awareness.                                                                      |

### Genuinely Important Note

TLP:WHITE was formally retired under FIRST's TLP v2.0 standard (August 2022) and replaced by TLP:CLEAR. Any documentation, training material, or client communication still referencing TLP:WHITE should be treated as using the outdated v1.0 naming — the meaning is unchanged, only the label was renamed.

### The One Rule That Matters Most

TLP is set by the ORIGINATOR of the information, and must never be upgraded (loosened) by a recipient without the originator's explicit permission. If in doubt about how far something can be shared, treat it as the most restrictive label that could plausibly apply, and ask the source before circulating it further.
